

Kao što smo naveli u <u>najavi</u> [1] ovog članka, instalacija Windowsa iz predloška ne "povuče" automatski *opsi-client-agent*, nego ga instaliramo "ručno", naknadno. Ovdje dajemo primjer instalacije jednog takvog klijenta. Nakon što klijent bude ispravno instaliran postaje "vidljiv" *opsi* serveru te možemo sa servera raditi pozive te pokretati određene procedure koje nam *opsi* omogućuje.

Krenimo s instalacijom. Na klijentskom *Windows 7* računalu pokrenemo "Run" s *NetBIOS* imenom "opsi", koje u našem slučaju prolazi. Ukoliko vam ne pronalazi *NetBIOS* ime, možete koristiti IP adresu *opsi* servera.

Nakon pokretanja \\opsi putanje, otvaraju nam se sve Samba dijeljene mape na opsi serveru. Nas zanima opsi_depot, označen na slici.

Published on sys.portal (https://sysportal.carnet.hr.)

Za pristup dijeljenoj mapi *opsi_depot* potrebno je upisati korisničko ime *pcpatch* i pripadajuću lozinku koju smo odabrali pri instaciji *opsi* servera.

Image: Computer Image: Computer	ppsi)	OK Cancel	

Nakon što smo unijeli ispravne podatke u mapi *opsi-client-agent* pronalazimo izvršnu datoteku *service_setup*, pokrenemo je dvostrukim klikom i slijedimo upute.

Nakon instalacije slijedi automatski restart klijenta.

Published on sys.portal (https://sysportal.carnet.hr.)

Naš klijent prilikom sijedećeg pokretanja kontaktira opsi server i potvrđuje svoju prisutnost na mreži.

Povezanost klijenta sa serverom možemo provjeriti i kroz *opsi* web sučelje, gdje jednim klikom provjerimo njegov "off" ili "on" status koji nam se prikaže prikladnim ikonicama u "On" koloni kao što je naznačeno na ilustraciji.

To znači da nas klijent "sluša" i spreman čeka naše naredbe:). O tome više u sljedećem nastavku.
